B103.3 Rate Terms and Conditions (Cont'd)

B103.3.5 Determination Of Mileage (Cont'd)

- B. When station locations of a private line service are located in different wire center serving areas, interoffice channel charges apply. Charges are based on the direct arline distance measured between the serving wire centers. To determine Interoffice mileage for purposes of developing rate distance between any two wire centers (intraexchange or interexchange) proceed as follows:
 - 1. Obtain the "V" and "H" coordinates for each wire center, as listed in the National Exchange Carrier Association (NECA)
 Tariff, FCC #4.
 - 2. through 5. (see B103.1.5.A)
 - 6. Obtain the square root of the result obtained in 5. This fractional number is the rate distance in miles. Bound up to the desired quarter, half or whole mile as specified by each service.

EXAMPLE: The rate distance is required between City One and City Two.

	•	
City One	7260	2083
City Two	7364	1865
Difference	104	218

Squared = 10,816 + 47,524 = 58,340

58,340 divided by 10 = 5834

Square root of 5834 = 76.38 = 77 Airline miles

- C. When a private line is furnished over facilities which the Company elects to provide on a direct basis and is not routed through a central office, one two-point channel charge from B103.4 will apply. The arrangement is limited to channels not more than one airline mile in length.
- **D.** For the purpose of applying multipoint charges, the bridging or hubbing locations are determined by that combination of airline distances connecting the serving wire center which will produce the lowest interoffice mileage charges. Bridging charges apply when three or more channels connect at the same location.
- **E.** For Series 1000, 2000 and 6000 channels the customer may specify the sequence in which the service points are to be connected in which case the rate mileage is the shortest airline mileage determined in accordance with C., which will connect the wire centers of the service points in the specified sequence.

2. Signaling Arrangements

Signaling arrangements are provided at the customer's option to arrange channels for suitable signaling. Signaling is required on all off-premises extension channels and tie line channels associated with PBX (or similar) systems.

a. Per local channel

3. Conditioning (Voice Grade Services)

a. Conditioning provides more specific transmission characteristics for data services. There are two types of C-conditioning and one type of D-conditioning, each with different technical specifications. C-Type conditioning controls attenuation distortion and envelope delay distortion. D-Type conditioning controls the signal to C-notched noise ratio and intermodulation distortion.

Conditioning is charged for on a per Local Channel basis for two-point and multipoint service. For two-point services the parameters apply to any path between any two service points.

b. The types and description of the available conditioning options are as follow:

Type Conditioning	Frequency Response Specifi	cationEnvelope Delay Distortion
		Specification
C1 (two-point or multipoint)	300-2700 Hz,	1000-2400 Hz, less
	-2dB to +6dB.	than 1000 microseconds
	1000-2400 Hz,	
	-1dB to +3dB.

c. When a channel is equipped with Type D1 conditioning and is utilized for voice communications, the Company does not undertake to represent that the channel will be suitable for such voice transmission.
